System architecture: input filtering, faithfulness checking, and the combined pipeline

Weekly project review

Input filtering pipeline

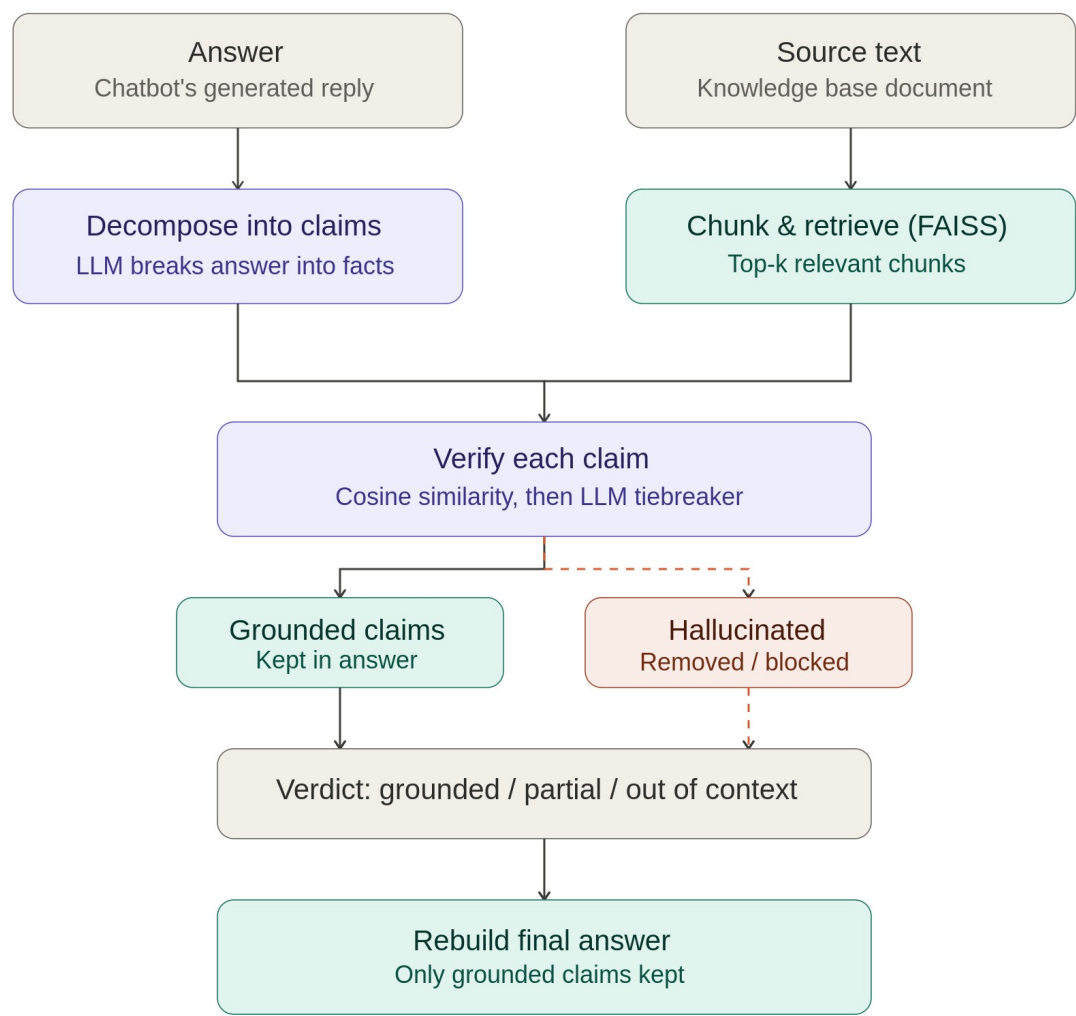

Built and owned by this team

Any of five stages (validation, rules, prompt injection model, moderation model, semantic matcher) can short-circuit straight to BLOCKED, shown by the dashed red lane.

Faithfulness checker pipeline

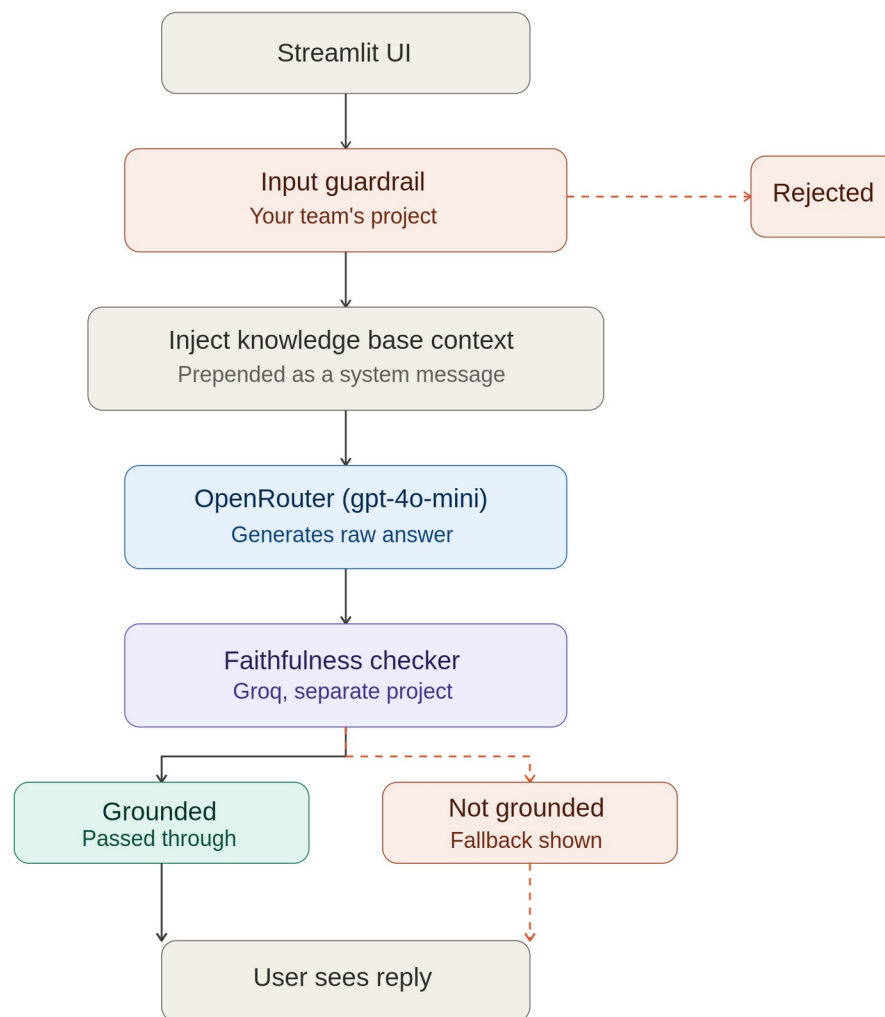

Built previously by a teammate; used here unmodified

Claims that fail verification are removed rather than shown to the user — *the dashed red path.*

Combined chatbot pipeline

How both projects integrate with the OpenRouter chatbot

Two reject paths exist: the input guardrail can reject before the model is ever called, and the faithfulness checker can trigger a fallback message after generation.
